Every flu season is different
It’s not too early to get the flu vaccine

Even if the vaccine doesn’t prevent the flu, it can lessen its impact.

The U.S. Centers for Disease Control and Prevention recommends that everyone ages six months and older gets the flu vaccine by the end of October to help build the community’s resistance to this season’s strain. Children ages 6 months through 8 years who require two doses of the flu vaccine should receive their first dose as soon as possible to allow the second dose (which must be administered four weeks or more later) to be received by the end of October.

Months were grouped by week ending date.

Even if the vaccine doesn’t prevent the flu, it can lessen its impact.
